

1. Why is it a critical rule to never taste or drink anything from lab containers? [1]

- The taste could be unpleasant and ruin your appetite for lunch.
- **A dangerous chemical, like an acid or base, might look exactly like water.**
- The liquids are reserved for experiments and should not be wasted.
- The liquids are often kept at very hot or very cold temperatures.
- You might spill the liquid on your project while trying to drink it.
- The containers may not have been washed properly.

2. What is the primary safety reason given for the absolute "no running or pushing" rule in the STEAM lab? [1]

- Mr. Cooper might get distracted from helping other students.
- It can cause vibrations that might ruin a sensitive experiment.
- Running makes the classroom too loud and distracting for others.
- **You might trip and fall onto sharp tools, hot equipment, or another student's project.**
- It is a general school rule that applies everywhere, not just the lab.
- You might accidentally knock over a water bottle.

3. Why is cutting a tough material like cardboard potentially more dangerous than cutting paper? [1]

- **It requires more force, which can cause the scissors to slip suddenly and lead to injury.**
- The noise from cutting cardboard can startle other students.
- Cardboard dust can get in your eyes.
- It can break the scissors, causing sharp metal pieces to fly off.
- It takes more time, increasing the chance of getting distracted.
- The edges of cut cardboard are much sharper than paper.

4. When walking with scissors, what is the correct and safe way to hold them? [1]

- Holding them by the handles with the blades closed and pointed away from you.
- Tucked into your pocket so your hands are free.
- **Holding them closed, by the outside of the blades with the points facing down.**
- Holding them by the very tip of the blades.
- Cupped in both hands to ensure they don't drop.
- Holding them by the handles with the points facing up.

5. What is the very first and most important action to take if you get a small cut or spill something in the lab? [1]

- Find the first aid kit and treat yourself.
- Clean up the spill with a paper towel and continue working.
- **Tell Mr. Cooper immediately.**
- Ask a friend what they think you should do.
- Ignore it if it seems minor.
- Wait until the end of class to report it so you don't interrupt.

6. Why are sugary drinks like juice and soda not permitted in the lab? [1]

- Spilled sugary liquid is harder to clean than water.
- Because they can attract ants and other pests into the classroom.
- Because they are generally unhealthy and the lab promotes good health.
- **If spilled, the sticky sugar can damage sensitive electronics and ruin projects.**
- Only Mr. Cooper is allowed to have drinks other than water.
- They do not mix well with the chemicals used in science experiments.

7. Which two items on a hot glue gun are identified as being extremely hot and capable of causing a serious burn? [1]

- The glue stick and the power switch.
- **The metal nozzle tip and the melted glue.**
- The plastic handle and the power cord.
- The trigger and the plastic handle.
- The power cord and the orange plastic casing.
- The built-in metal stand and the trigger.

8. When you are not actively using a hot glue gun, even for a moment, what should you do with it? [1]

- Ask a friend to hold it for you.
- Unplug it and wait for it to heat up again when you need it.
- Hold it in your hand to keep it ready for the next step.
- Put the metal nozzle on the edge of the table facing towards others.
- **Place it upright on its built-in metal stand or lay it down on its side on a piece of scrap cardboard**
- Point the nozzle toward the ceiling so it can't drip on anything.

9. When passing scissors to another person, how should you safely hand them over? [1]

- **Close the scissors, hold the outside of the blades, and offer the handles to the other person.**

- Announce "scissors coming" and place them near the person.
- Slide them across the table.
- Hold the handles and offer the blades to the other person.
- Gently toss them to the person so you don't have to get up.
- Hold them vertically and offer them point-first for an easy grab.

10. What is the correct procedure to follow if you accidentally get hot glue on your skin? [1]

- Wait for it to cool down on its own, then peel it off.
- Quickly try to peel it off with your fingers before it hardens.
- Immediately wrap the burn tightly in a paper towel.
- Apply pressure to the burn to stop the pain.
- **Tell Mr. Cooper immediately and run the burn under cool water.**
- Submerge the affected area in a bowl of ice.
