Q11	A	B	C	D	E	F
Q12	A	B	C	D	E	F
Q13	A	B	C	D	E	F
Q14	A	B	C	D	E	F

1. Which statement best defines a "polyatomic ion"?

- A. A metal atom that is part of an acid.
- B. A group of covalently bonded atoms that has an overall net electrical charge.
- C. An ion formed from a single atom that has multiple possible charges.
- D. An element that can exist in many different forms.

2. What is the correct chemical name for the simple ionic compound CaO?

- A. Calcium oxide
- B. Calcium oxygen
- C. Monocalcium monoxide
- D. Calcium(II) oxide

3. What is the correct chemical name for the acid H_2SO_4 , which contains the sulfate ion (SO_4^{2-})?

- A. Sulfuric acid
- B. Sulfurous acid
- C. Hydrosulfuric acid
- D. Hydrogen sulfate acid

4. The polyatomic ions nitrate (NO_3^-) and nitrite (NO_2^-) are important in naming certain acids. Both of these ions contain which element in addition to oxygen?

- A. Nitrogen
- B. Carbon
- C. Chlorine
- D. Sulfur

5. In the chemical formulas of most acids, which element is typically listed first?

- A. Hydrogen
- B. Nitrogen
- C. Oxygen
- D. Carbon

6. A compound formed between a metal element and a nonmetal element is generally classified as:

- A. an ionic compound
- B. an acid

- C. a covalent compound
D. an element
7. What is the correct chemical name for the binary acid HBr?
- A. Hydrobromous acid
B. Bromic acid
C. Hydrogen bromide acid
D. Hydrobromic acid
8. When naming a binary acid, what prefix is typically added to the beginning of the name?
- A. per-
B. poly-
C. hydro-
D. non-
9. If a polyatomic acid contains a polyatomic ion whose name ends in "-ate" (e.g., nitrate), what will the ending of the acid's name be?
- A. hydro- -ic acid
B. -ide acid
C. -ic acid
D. -ous acid
10. When naming a simple ionic compound consisting of a metal and a single nonmetal element, what suffix is typically used for the nonmetal's name?
- A. -ite
B. -ic
C. -ide
D. -ate
11. What does the term "binary ionic compound" mean?
- A. An ionic compound containing two atoms of the same metal.
B. An ionic compound containing two different polyatomic ions.
C. An ionic compound made of atoms from only two different elements, one metal and one nonmetal.
D. An ionic compound that is twice as strong as other ionic compounds.
12. Which of the following chemical formulas most likely represents an acid?
- A. NaCl
B. CO₂
C. H₂O
D. HCl
13. Roman numerals (such as I, II, III) are used in the names of some ionic compounds to indicate:

A. The positive charge of the metal cation, especially when the metal can form ions with different charges.

B. The negative charge of the anion.

C. The total number of atoms in one molecule of the compound.

D. The number of nonmetal atoms in the formula.

14. Prefixes such as 'mono-', 'di-', and 'tri-' are commonly used in the systematic naming of which type of compounds?

A. Polyatomic acids (Oxyacids)

B. Ionic compounds containing polyatomic ions

C. Binary acids

D. Binary covalent compounds
