

1. What does ALT+F4 do, and why should you use it with caution?

- It formats the C: drive and reinstalls Windows.
- It turns off the computer monitor without closing applications.
- It immediately closes the currently active program or window, which can cause unsaved work to be lost if not saved first.
- It duplicates the active layer in a 3D modeling program.
- It refreshes the current webpage or folder view.
- It opens the fourth tab in your internet browser.

Answer:

2. What is the purpose of the CTRL+Y shortcut, and how does it relate to CTRL+Z?

- It yields control of the computer to a remote administrator.
- It redoes an action that was previously undone by CTRL+Z, or repeats the last command.
- It opens the YouTube website in the default browser.
- It undoes two actions at a time instead of just one.
- It creates a new y-aligned 3D grid in modeling software.
- It selects all text from the cursor position to the end of the document.

Answer:

3. Why is the CTRL+Z shortcut considered one of the most important digital safety tools?

- It zooms in to give a closer view of the current workspace.
- It permanently deletes all changes made during the past hour.
- It undoes the most recent action, allowing you to instantly recover from accidental deletions or mistakes.
- It locks the keyboard to prevent unauthorized access.
- It compresses all files into a ZIP archive to save disk space.
- It restarts the operating system in Safe Mode.

Answer:

4. What is the purpose of holding ALT and pressing TAB (ALT+TAB), and why is it useful?

- It switches the keyboard language between English and Chinese.
- It opens a new browser tab without closing the current one.
- It closes all open background tasks to speed up the SPU.
- It displays an overview of all open applications and allows you to switch

between them quickly without using the mouse.

- It tags the current file with an alternative file name.
- It inserts a five-space tab indentation in a coding editor.

Answer:

5. What does the CTRL+V shortcut do, and why is it beneficial?

- It creates a new volume partition on the hard drive.
- It inserts (pastes) the most recently copied or cut item at the cursor position, saving time on retyping.
- It verifies spelling and grammar across the entire project.
- It saves the current document under a new file name.
- It selects all text and images in the current document.
- It cuts the selected text and stores it in a temporary folder.

Answer:

6. How does CTRL+X differ from CTRL+C, and when is it best to use it?

- CTRL+X removes the original item but does not save it to the clipboard.

- CTRL+X and CTRL+C perform the exact same function with no difference.
- CTRL+X removes (cuts) the selected item from its original place and copies it to the clipboard, making it ideal for moving content.
- CTRL+X exports the file directly to an external USB flash drive.
- CTRL+X deletes the document, while CTRL+C only closes it.
- CTRL+X copies only images, while CTRL+C copies only text.

Answer:

7. Why should computer science students frequently use the shortcut CTRL+S while working?

- It saves the current progress to the storage drive, preventing loss of work if the program crashes or the computer powers off.
- It opens the System Settings menu to adjust screen brightness.
- It shares the current project directly to social media.
- It speed-checks the machine for viruses and security threats.
- It shuts down the computer safely at the end of the class.
- It searches the internet for related reference images.

Answer:

8. What does the CTRL+A shortcut do, and in which scenario is it most useful?

- It alphabetizes all the files inside the current directory.
- It automatically archives old files into a backup folder.
- It aligns all paragraphs to the center of the page.
- It activates the audio speakers on the computer.
- It adds a new blank page or slide to the presentation.
- It selects all items, text, or files in the current window at once, making it easy to copy, move, or delete everything quickly.

Answer:

9. Consider the following file path: "E:\QA\Pictures\Screenshots\Screenshot1.png". Which statement accurately explains its structure?

- The file path indicates an internet website URL rather than a local storage location.
- "QA" is a file extension, and "Screenshot1" is a subfolder inside "E:\".
- "Paint" is the file extension, which means it is a program executable.
- "Screenshot1.png" is the root drive, and "E:\\" is the file name.

- "E:\\" is the storage drive, "Screenshot1.png" is the file with a .png image extension, stored inside the "Screenshots" subfolder of "Pictures" under "QA".

- "Pictures" is the main drive letter, and "E:\\" is the name of the software used to open it.

Answer:

10. What is the function of the CTRL+C shortcut, and why is it useful when working on a computer?

- It closes the currently active window to save system memory.
- It changes the selected font style to center-aligned text.
- It deletes the selected text permanently from the storage drive.
- It opens the Command Prompt terminal window.
- It copies selected text or files to the clipboard without removing the original, allowing you to duplicate content quickly.
- It pastes content that was previously stored on the clipboard.
